fire inspired art

From concept to creation by Rees Bowen

Rees Bowen, process image 1990
mentored by Bill Bagley, Art Director, Texas Tech University

INTRODUCTION

It is my feeling the qualities of sensuality often reveal new ideas and understanding about this age-old craft.

Glass represents a major achievement in the history of technological developments. Since the Bronze Age, about 3000 BC, glass has been used to make various kinds of objects. It was first made from a mixture of silica (from sand), lime and an alkali such as soda or potash. These remained the basic ingredients of glass until the development of lead glass in the seventeenth century. When heated, the mixture becomes soft and malleable and can be formed by various techniques into a vast array of shapes and sizes. In contrast to most materials, glass lacks the crystalline structure normally associated with solids, and instead, retains the random molecular structure of a liquid. In effect, as glass cools, it progressively stiffens until rigid, without setting up a network of interlocking crystals – typically associated with the process. This is why glass shatters so easily, why glass deteriorates over time (a process called devitrification), and why glassware must be slowly annealed (reheated and uniformly cooled) to release internal stresses induced by uneven cooling. The term "glass" does not refer to a specific chemical compound, since different types of glass have a different chemical composition and exhibit different chemical and physical properties. Glass has the widest applications in modern times, both in industry and the home. Some types of glass are most suitable for window-panes or services of cut "crystal," others are designed to be spun into fibers or formed into the heat shields of spacecraft.

In the past working with glass proved to be a necessity to all cultures. It is a material of extreme versatility; excusing the inherent nature of a unique art-form. Recently, the art of glass has become acknowledged as a medium which gives us a new sense of reality to the possibilities of form. Glass-art continues to gain stature in the art community as a highly respected skill.

An incredible variety of approaches can be taken when working with glass. The style of craftsmanship ranges from classical European (Italian, German, English) to free-form contemporary. Our approach respects the traditional process while encouraging and nurturing the extreme versatility the material offers. In my experience each piece I have created reveals multiple paths, at multiple times, resulting in so many works of art to fathom. Fact is, I will not be able to explore them all, at least physically... that's not to say I'm not making them in my mind.

Glass has become a re-emerging art form in the recent decade. A material with extreme versatility, the art of glass goes far beyond the functional and sculptural; into the realm of sensuality. The intensity of working the material creates inspiring effects thru a choreographed performance, achieving a symphony of end results. Even more, it has become recognized as a highly respected skill. Spiralglass is about combining the sport of physical strength, instinctive reactions, and design into the art of glassblowing.

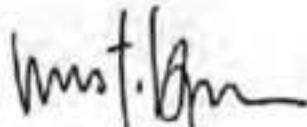

Our background in glass art primarily consists of specialty installations with a wide variety of clientele. Typically, these incorporate a conceptually arranged series of glass art forms, as well as one-of-a-kind individual hand-blown glass art forms. These installations are designed to complement the space for which they are created and provoke discussion. Ideally, we would propose to deliver several pieces of hand-blown glass art which proves the variety of our talent, and establishes feedback from several parties. This provides the creation for unique, comprehensive conceptual body of work with forethought and value.

The glass oriented gallery Open Studio has become a tradition over the last 10 years. There are several live demonstrations of glass blowing which will entail and reveal the creativity and energy involved with the endless potentials provided by the material's inherent natural qualities. To conclude the event, the gallery often invites evening guests to participate in "glass bowling", a process where the artists smash discarded pieces; then re-use the broken shards to create new objects of glass art.

Our 'Blown' exhibitions present unique, hand blown art forms as well as other fire-inspired art work. Artists give live demonstrations of the phenomenal process revealing the creativity and energy involved with creating sensual curves and beautiful colors in the endless potentials of these inspiring and one of a kind art glass creations.

Spiralglass, Inc., Firehaus, Inc., and Lookimagine, LLC have been commissioned for a wide variety of art work and installations; including work for The White House Collection, Stephan Pyle's Restaurant, Neiman Marcus, Zales Corporation, Marriott Hotels, Starwood; as well as work for collectors, developers, architects, interior design firms, and general contractors / custom home builders. We are currently working with various developers, corporations, designers, galleries, museums, and art collectors on a variety of interests.

with the aim to provide quality service with forms that create a unique presence in space, our work continues to evolve, generating new ideas and forms...

DESIGN SERIES

APPROACH

The Glass forms Rees creates are intended to present a unique presence in space. The qualities of sensuality often reveal new ideas and understanding about this age-old craft. The concept behind the artwork he creates continues to evolve; generating new ideas and forms. It challenges the envelope of the form, allowing it to remain on the edge.

"My direction and approach is partially about the process, as well as the end result, from the initial conception of the concept in the complete installation. I am linked to the color, textures, and patterns in order to bring another dimension to the overall concept of the work. This relates my ideas to the perception of the overall scope influenced by my art forms, thus reinforcing the creation of wholistic design and consciousness." The term "holistic" references the interlocking and connecting each of Rees' art forms carry through one another. The energy created within each piece is tied to the next.'

Belly Buttons

The concept for these pieces was to emphasize design on the inside center of the gravity platter design. The process for the gravity platter series was basically reversed so that the inside center of the piece had a twisty spiral design. As the process evolved the result created a type of button feeling in the center.

fat wraps

The name refers to the process. The thick dominant color wrapped in a spiral around the form. The majority of the pieces in this series incorporate a clear base / background and incorporates transparent color for the fat wrap.

SUMMER PLATTERS

These pieces culminated through combining belly buttons, clouds, spin, scallops, and gravity works. The intention with this series is to provide more dimensions thru layers, patterns, and transparency. The process plays a critical part in orchestrating these large scale roundels.

thin cakes

As suggested, these pieces are multi-colored, textured, and are in a variety of primarily platter / vessel like forms. They are all very thin...Through the final heat and spin process they are as thin as you can get; yet they are surprisingly sturdy. These have been designed with influence from the icing on cake fluidity, but with the spiral twist incorporated into many of the patterns and colors in this series.

spider

The spider concept is found incorporated throughout many bodies of work. It refers to the application providing a specific spiral-dotted color pattern and is a general term used to categorize the style and feeling evoked through the form.

TRI-POD

This series was initially formed in 1989 through the influence and collaboration with Bill Bagly. Bill directed the glass program at Texas Tech University. The concept is a take off on the evoilo used in traditional venetian goblets which creates focus on the patterns and colors of each piece by creating an integrated foot, or stand, that visually lifts the piece off the ground. As these pieces developed, color was explored into the foot which proves to add to the sculptural spirit in the series. This concept influenced the Spirit Catchers, Aquanauts, and others.

Gravity platter

This series expands across several other design concepts and is named through emphasis of the process of spinning and utilizing the effects of gravity to create the form. The gravity platters often incorporate optic molds to enhance the design and have come to be known as Scalloped forms.

snake skin

The snake patterned concept is found incorporated throughout many bodies of work. It refers to the application providing multiple spiral-dotted color patterns overlapping one another with the slightly offset angled spacing of optical dotted patterns. It is another general term used to categorize the style and feeling evoked through the form.

CLOUD VESSELS

This series expands across several other design concepts and is named through emphasis of the process of spinning and utilizing the effects of gravity to create the form. The Cloud vessels are very large crucibles with spiral wrap and spider / snake patterns.

balls of fire

Basically sphere's set in a large gravity platter / bowl type form. The balls emanate colors from the main cradling bowl form. This series was initially created as a way to display decorative ornaments. Clientele demand led to providing concept and meaning to form, shape, color, pattern, and specific focus on environment thru clientele demand.

perfume

These are simplified traditional goblet forms extremely simplified and at a small vessel scale. Very simple curvilinear forms with glass fins/mimicking the base form. A version of this lead to sculptural inverted forms used to display jewelry in retail stores.

goblet

These incorporate the traditional Italian glass elements using an age-old technique. They are thin and somewhat dainty, so to speak, but also incorporate dragon, swan, and other bold detail features. Many of the goblets incorporate the teacup pattern and texture. Through exploration, these pieces have influenced other concepts such as the Drop vases, Totems, Venetians, Aquanauts, Cosmonauts, and Omagami.

twisty cups

Created using traditional Italian techniques, this series is true to process, form, and functionality. However, they are also very sculptural due to the thickness and texture. These pieces range from usable drinking glasses to ornate interpreted classical cups.

ornagami

This series incorporates the traditional Italian goblet techniques adjusted to for vertical hanging sculptural forms similar to ornaments. Think of simplified patterns found in doilies applied to glass forms in three-dimensions. It should be noted the exploration in adapting this process directly fertilized the creation of Aquanauts, Cosmonauts, and the unique forms found in the Spirit Catchers.

Spirit Catcher

It is a tradition among glassblowers to create and hang a spirit catcher, or 'witchball,' in their studios to assure successful glassblowing and good fortune. As early as the mid-1700's, glassblowers were known to hang witchballs in their homes to protect them from witches' spells and evil spirits. It is thought to work by attracting evil spirits with the bright colors and patterns. When evil spirits are near, they are lured to the opening in the underside of the piece. Here they become confused and unable to escape until they eventually dissipate. Place the spirit catcher carefully, and it will serve you well.

COSMONAUT

Although a completely unique process is involved in the creation of these pieces, they are direct descendants of the Aquanauts. Sometimes referred to as 'Splats', 'Amoeba's, and 'Starfish', these pieces resemble some organic form one might find under sea. They are influenced through personal observation and interpretation.

aquanaut

This series was initially formed in 1989 through the influence and collaboration with Bill Bagly. Bill directed the glass program at Texas Tech University. The concept is a take off on the evoilo used in traditional venetian goblets which creates focus on the patterns and colors of each piece by creating an integrated foot, or stand, that visually lifts the piece off the ground. As these pieces developed, color was explored into the foot which proves to add to the sculptural spirit in the series. Similar to the Spirit Catchers and Cosmonauts, these pieces resemble some organic form one might find under sea. They are influenced through personal observation and interpretation.

VENETIAN

The Venetians are basically large scale goblets, simplified. Simplified only due to process. Very elegant and modern with a hint to memories through their relatively traditional forms. These pieces incorporate multiple forms combined translated literally into their larger forms. This concept gave way to the creation of the Totem series.

CHALIS

These are basically oversized, simplified goblet forms with no derivative on the Totem design connected with oversized evoilo forms. Like the Venetians, they are very elegant and modern with a hint towards traditional Italian glass forms. These pieces have been well received with the 'Symphony' chalis being accepted into The White House Collection.

III-VIII (duo & progression)

There are two types of these designs with this series encompassing the opposites attract theory. One type focuses on layers to create a dichotomy with two different looks in a single piece dependant on lighting from either the back or the front resulting in very apparent color and pattern details being revealed. The other is based on form and shape. These are intended to embrace on another in unison. Each form studies the other in progression. These series also place further emphasis on the Spiral concept as each piece leads to the next in form, color, and texture.

sophy set

These pieces are very curvy with simple singular shapes, forms, and color. They are similar to the Venetian series in nature. Again, oversized, elongated tubular forms; these pieces average 30" in height. Most of these pieces incorporate a contrasting color for the lip wrap.

lo-ofi vases

The name is in reference to the top neck in the forms which incorporates a curvy loop at the top. With an elongated integral tubular loop form, these pieces are average size ranging from 6" to 18" in height. Color and pattern vary and often include the spiral wrap pattern with a single base color and contrasting lip wrap.

trumpet vase

The name is similar to the form in this series. Being elongated fluted tubular forms, these pieces are oversized in scale averaging 42" in height. Color and pattern design ranges, but usually incorporates the spiral wrap pattern in multiple overlapping layers.

curlingia and jellies

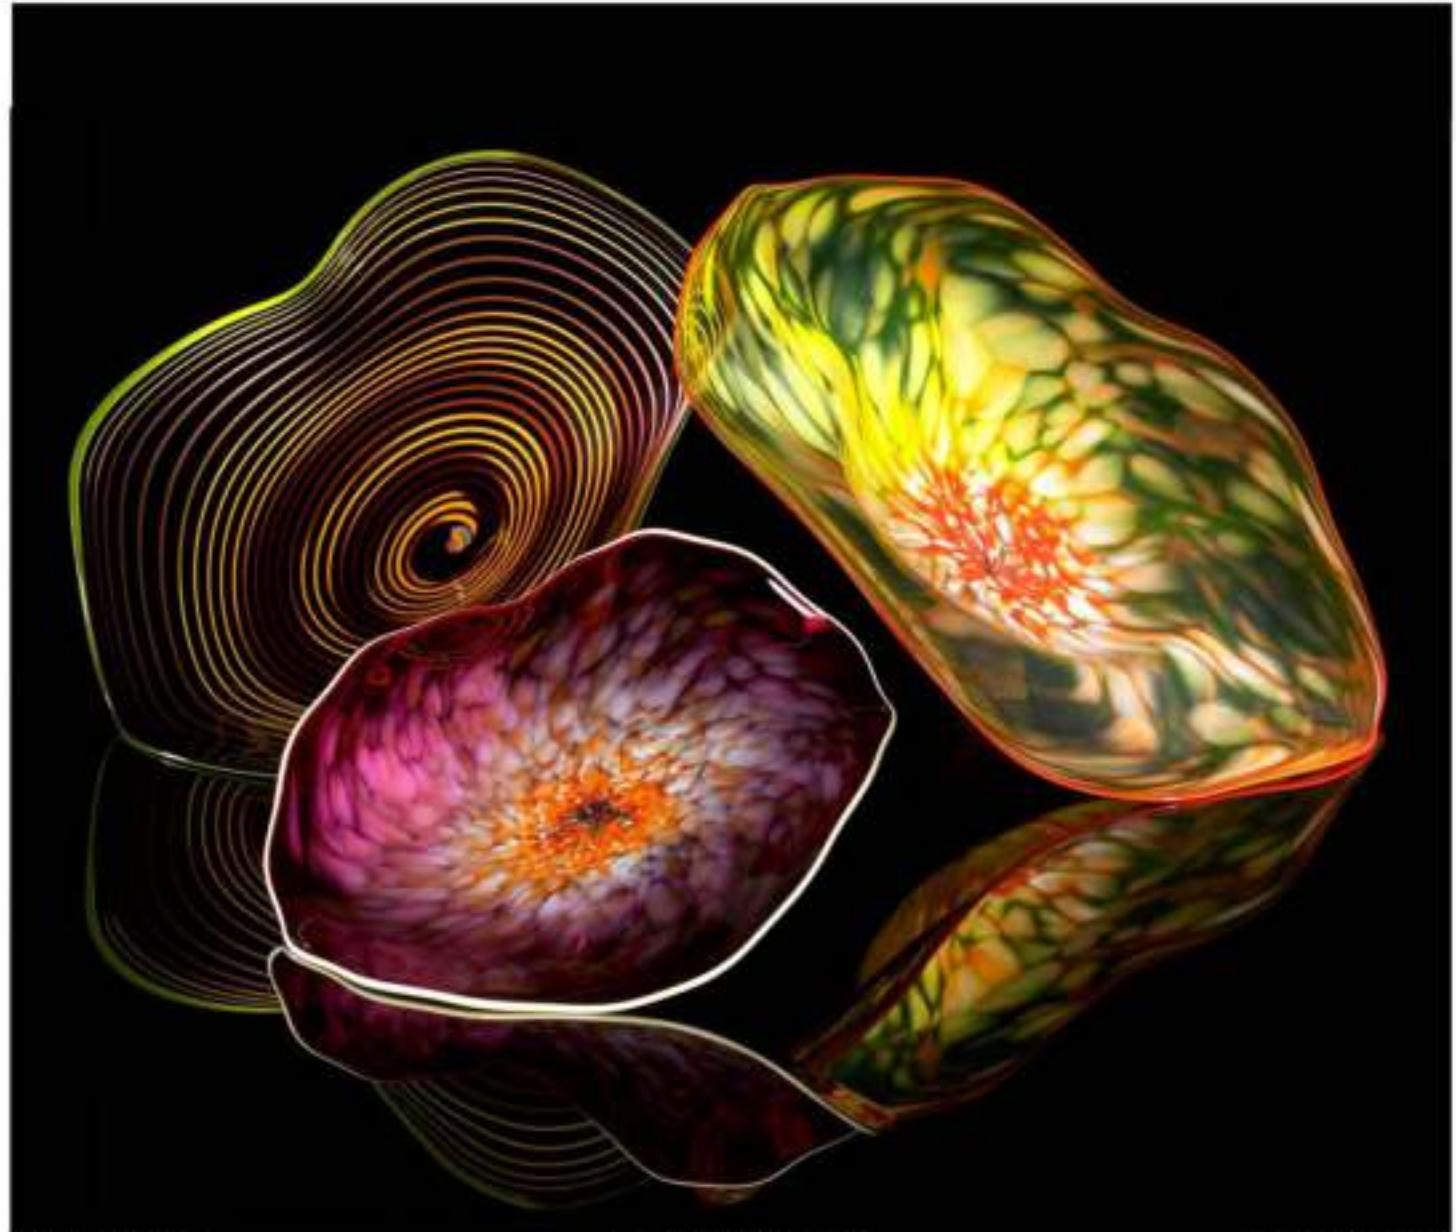

This body of work obviously takes reference from the sea forms in their titles. They both include a contrasting transparent single sandblasted color in a pointed cylinder form reaching out from a main focal base piece which is much more detailed in color, form, and pattern. These pieces stem from an enlarged version of the cosmonauts.

reeds & ribbons

These series resulted through the Drop Vase series in combination with a modified interpretation of pulling cane and lettuce. The reeds are vertical in application, extending from the ground. The ribbons tend to be more fluid in nature and horizontally mounted on wall surfaces.

ONE THING LEADS TO THE NEXT THRU EXPLORATION

Just by nature, the approach taken towards exploration has always led Rees to explore multiple variations resulting from a single experiment. This approach inherently produces un-abund possibilities. In Rees' mind, there are 'so many variations on ideas for direction encountered from each pursuit, it would be impossible to explore all of them. Take that thought and in cumulation with other deviations involving the processes of creation, patterns, colors, and forms at a minimum...well, it just takes the possibilities to another level all together.'

CONCEPT SKETCHES FOR COMMERCIAL LOBBY

The underlying concept approach for this design stems from expanding knowledge and fulfilling the desire to learn through several stages. Each stair landing represents a different "layer" of knowledge and learning. This is communicated through a transcending color scheme on each level; while retaining an overall composition for the sculpture. For example, the lowest level and the top level would have similar color schemes suggesting the cycle of evolution and education. The glass platters and glass ribbons would be mounted to accentuate the burn panel composition and design. The panels will be continuous from top to bottom with a total of 7 panels. The color schemes for the glass platters would be complimentary to the color schemes in the glass ribbons throughout the entire sculpture. The glass, mounted on the panels will appear to be floating from the panels. These panels include natural wood and transparent blue tint using auto-paint as a finish and protective coating. The general concept is based on promoting a positive creative education and the importance of the learning experience.

Sculpture

OVERVIEW

The following includes general sculpture categories; although Rees' approach taken towards exploration has always provided him with uncountable ideas for new forms and creations. These sculptures display but a glimpse of the breath of ideas and fortuations Rees has yet to create.

DROP video

This series was initially formed in 1989 through the influence and collaboration with Bill Bagly. Bill directed the glass program at Texas Tech University. The concept is a take off on the evolo used in traditional venetian goblets which creates focus on the patterns and colors of each piece by creating an integrated foot, or stand, that visually lifts the piece off the ground. As these pieces developed, color was explored into the foot which proves to add to the sculptural spirit in the series. This concept became adopted within the Spirit Catchers, Aquanauts, and other series.

CLOUD DROPS

This series expands across several other design concepts and is named through emphasis of the process of spinning and utilizing the effects of gravity to create the form. The Cloud vessels are very large crucibles with spiral wrap and spider / snake patterns.

SEVENX1 PREGOERS

These pieces cumulated through combining belly buttons, clouds, spin, scallops, and gravity works. The intention with this series is to provide more dimensions thru layers, patterns, and transparency. The process plays a critical part in orchestrating these large scale roundels.

SATELLITE

This series was initially formed in 1989 through the influence and collaboration with Bill Bagly. Bill directed the glass program at Texas Tech University. The concept is a take off on the lori was explored into the foot which proves to add to the sculptural spirit in the series. This concept became adopted within the Spirit Catchers, Aquanauts, and other series.

CUBIST

This series was initially formed in 1989 through the influence and collaboration with Bill Bagly. Bill directed the glass program at Texas Tech University. The concept is a take off on the evolo used in traditional venetian goblets which creates focus on the patterns and colors of each piece by creating an integrated foot, or stand, that visually lifts the piece off the ground. As these pieces developed, color was explored into the foot which proves to add to the sculptural spirit in the series. This concept became adopted within the Spirit Catchers, Aquanauts, and other series.

VENETIAN

The Venetians are basically large scale goblets, simplified. Simplified only due to process. Very elegant and modern with a hint to memories through their relatively traditional forms. These pieces incorporate multiple forms combined translated literally into their larger forms. This concept gave way to the creation of the Totem series.

urchins and jellyfish

This body of work obviously takes reference from the sea forms in their titles. They both include a contrasting transparent single sandblasted color in a pointed cylinder form reaching out from a main focal base piece which is much more detailed in color, form, and pattern. These pieces stem from an enlarged version of the cosmonauts.

Gravity platter

This series expands across several other design concepts and is named through emphasis of the process of spinning and utilizing the effects of gravity to create the form. The gravity platters often incorporate optic molds to enhance the design and have come to be known as Scalloped forms.

SKY signs

It is a tradition among glassblowers to create and hang a spirit catcher, or "witchball," in their studios to assure successful glassblowing and good fortune. As early as the mid-1700's, glassblowers were known to hang witchballs in their homes to protect them from witches' spells and evil spirits. It is thought to work by attracting evil spirits with the bright colors and patterns. When evil spirits are near, they are lured to the opening in the underside of the piece. Here they become confused and unable to escape until they eventually dissipate. place this spirit catcher carefully, and it will serve you well.

reeds & ribbons

These series resulted through the Drop Vase series in combination with a modified interpretation of pulling cane and latticino. The reeds are vertical in application, extending from the ground. The ribbons tend to be more fluid in nature and horizontally mounted on wall surfaces.

Stalagmites and Stalactites

This series was initially formed in 1989 through the influence and collaboration with Bill Bagly. Bill directed the glass program at Texas Tech University. The concept is a take off on the evolo used in traditional venetian goblets which creates focus on the patterns and colors of each piece by creating an integrated foot, or stand, that visually lifts the piece off the ground. As these pieces developed, color was explored into the foot which proves to add to the sculptural spirit in the series. This concept became adopted within the Spirit Catchers, Aquanauts, and other series.

IDEALOGY

" My direction and approach is partially about the process, as well as the end result; from the initial conception to the complete installation. I am linked to the colors, textures, and patterns. My art work is designed to include full dimension of the overall concept to fruition. This portrays my sensitivity in working with this material, adapting to art works' habitation. This enhances the overall perception of space my art forms inhabit. It reinforces fore thought of creation and continuation of my work."

DEEP ELLUM SHOWCASES FIREHAUS GALLERY PRESENTING "BLOWN" - A GLASS ART EXHIBITION

Firehaus Gallery is presenting the beginning of a unique concept and series of gallery exhibitions that will feature an array of fire inspired artwork. You are invited to experience the first in this series where fire and glass come together to create timeless pieces of art.

FRIDAY, JULY 21st

Programme:

- 6 pm – gallery viewing
- 8:30 – live demonstration(s)
- 9:30 – glass bowling

Deep Ellum, TX (July 2006) "Blown" will exhibit unique, hand blown art forms as well as paintings created with fire. Rees Bowen, the creator of *Firehaus Gallery* and *Spiralglass Studio*, Matt Hare and other artists will perform a live demonstration of the phenomenal process revealing the creativity and energy involved with creating sensual curves and beautiful colors in the endless potentials of these inspiring and one of a kind pieces of hand crafted glass. *Spiralglass Studio* has been commissioned for upscale art installations for The White House, Stephan Pyle's Restaurant, Neiman Marcus, Zales Corporation as well as Interior Designers, Custom Home Builders and private collectors. They are currently working with various galleries, museums, and art collectors on a variety of projects.

To conclude the event, the artists of *Firehaus* will invite guests to participate in "glass bowling." This is a process where the artists' use the broken fragments to form new creations of glass art.

For more information about *Firehaus Gallery* or *Spiralglass Studio*, call 214-361-6700 or visit www.firehaus.com and www.spiralglassinc.com.

Profile

Ross Brown, the man behind Spiralglass, has worked with glass as an art medium for more than two decades. While studying at London's Architectural Association School of Architecture in the late 1980s and early '90s, Brown learned his iterative process and soon began creating art across a number of media, including glass, steel, wood, and photography. The art that sits in Spiralglass ranges from decorative plates to thin, winding vessels to abstract paintings. Though many of Brown's glass pieces have organic designs, the name Spiralglass doesn't necessarily come from the look of his art. Instead, Brown says "spiral" refers to the energy that flows between his works, connecting audiences of art to the next.

Rees Bowen

Rees Bowen has been working with glass since 1990. His studies at the Architectural Association School of Architecture in London, England (1989-1991) were the proving grounds for the process of creative experimentation. His studies in London expanded his design horizons by allowing his concepts to become the guiding force throughout the design process. This incorporated his ideas of the creation of form in space, through the use of appropriate artistic/industrial aesthetics, using various materials. His work, both in Architecture and Art, reveals the idea of creating objects within a space which have a distinct influence over an individual's experience of that space. Creating and evoking feelings through the dynamics of glass to inhibit feelings within a particular space created the original inception of Spiral-glass, Inc. and Lockimagine, LLC. Rees' design approach and ideas remain the primary basis for his creations.

Rees graduated with honors from Texas Tech University (1994), obtaining a Bachelor of Architecture Design Specialization Degree. Additionally, he achieved specialized Minors in Sculpture, Glass, and Photography. His influences include mentors Peter Thomas, Peter Sabara, and Nigel Coates; while at the Architectural Association in London; and Bill Bagley, a noted and respected three dimensional sculptor. His theories and ideas were further enhanced by the Situationalist's International movement in Europe. As such, Rees formed IV Architecture, Inc. in 1998 as a vehicle to create meaningful land-planning and development opportunities through, in part, his architectural career.

Rees has been involved in Spiralglass, Inc. for over 25 years. In the past, he was involved with Hickory Street Hot Glass, Inc. and Texas Hot Glass, L.L.C.. He is also responsible for the formation of Fehaus Gallery, Inc., originally located near Exposition Park in Dallas, Texas. This art gallery is focused on fire related arts. In the recent decade, Rees has been working on the formation of the Evolve Gallery and The Southern States Glass Art Cooperative. Rees has been involved as a designer and consultant with large scale corporate commissions, private commissions, and light fixture design. In 2002, his 'Symphony Challs' was accepted into The White House Collection, a prestigious honor. Some of his past clientele include Publicis Blum, Delinea, Neiman Marcus, Precept Builders, J.P. Morgan Chase Bank, Caleberry Bakery, Dallas County Community College, Zales Corporation, the Nasher Sculpture Center, Fulbright and Jaworski (law firm), and Stephan Pyle Restaurant, to name a few. Rees' artwork has been featured at galleries in local and national art galleries. He is currently designing work for a Casino in Louisiana, unique design concepts for various clientele, and other public works projects.

Artist Statement:

"My design approach is about an ideology I have created to aid in transforming an initial conceptualization of an idea into a three-dimensional object. My artistic design direction is about the ability to solidify the perception of my creative concepts. I tend to use words, phrases, and imagery, initially, to support my art through various mixed media; including, but not limited to, architecture, three-dimensional sculpture, painting, and photography. My focus relies on developing a comprehensive, project specific, design parameter that is geared towards an order to achieve comprehensive architectural forms and objects lending to a unique spatial experience. Initially from function, evolving into the formation of a design approach, my concepts and ideas are used to support the interior and exterior experience."

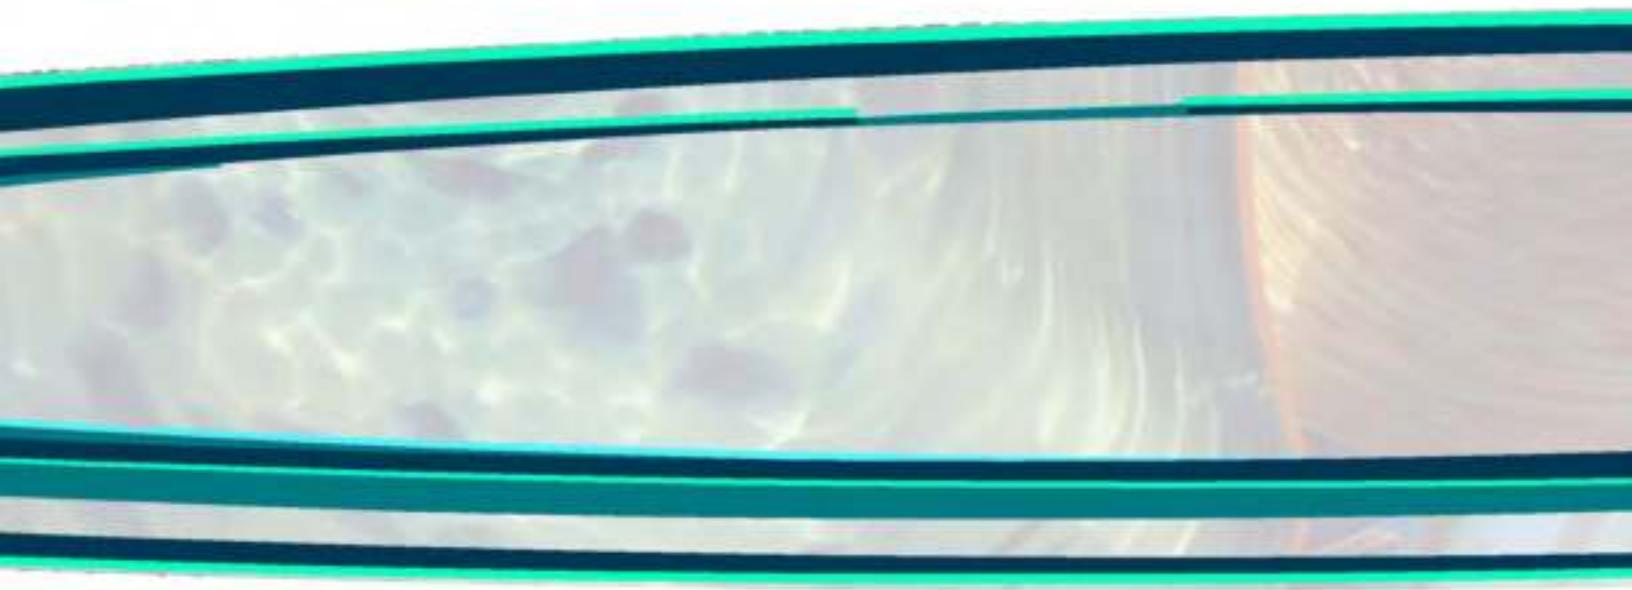

"The direction as described above is a tool I use in the development of my creations in all types of architecture. I view the term 'architecture' to involve a wide range of definitions, as I believe all things in existence have an 'architecture' to their being. Each conceptual idea I formulate involves ideas appropriate to the process appropriate for the end result desired, addressing the goals of the client, and the material(s) used to portray my idea(s)."

"The Glass forms I create are intended to present a unique presence in space. The qualities of sensuality often reveal new ideas and understanding about this age-old craft. The concept behind the artwork I create continues to evolve; generating new ideas and forms. It challenges the envelope of the form, allowing it to remain on the edge. My direction and approach is partially about the process, as well as the end result; from the initial conception of the concept to the complete installation. I am linked to the color, textures, and patterns in order to bring another dimension to the overall concept of the work. This relays my ideas in the perception of the overall space inhabited by my art forms; thus reinforcing the creation of wholistic design and composition. The term "spiral" references the intertwining and connection each of my art forms carry through one another. The energy created within each piece is tied to the next." My goal is to make people more aware of their environment through their spatial awareness and understanding of their spatial experience."
